PROFILE

Backend-focused software developer with hands-on experience building algorithmic trading and arbitrage systems in crypto, particularly around cross-chain markets and CEX integrations.

Most of my experience in trading systems started from a simple process: finding an interesting market inefficiency, understanding how the underlying protocols work, and then building the infrastructure needed to test and exploit it. That combination of research, experimentation and engineering is the part of software development I enjoy the most. I initially approached crypto as a trader, but after seeing how much of an edge could be gained through automation and software, I decided to learn how to build those systems myself.

I have worked with real-time market data and automated execution of blockchain transactions on most DeFi protocols (EVM), mainly building in Go and deploying systems in Linux environments. I am particularly interested in on-chain market structure, emerging DeFi protocols, MEV, prediction markets and problems where execution speed, reliability and capital efficiency matter.

EXPERIENCE

Independent Software Developer — Algorithmic Trading & Crypto

2024 - Present

Design and develop automated trading systems focused primarily on cross-chain arbitrage and on-chain market opportunities.

- Research inefficiencies across different chains, venues and liquidity sources and translate trading ideas into automated systems.
- Build cross-chain arbitrage infrastructure, combining on-chain state, protocol data and market prices to identify executable opportunities.
- Integrate centralized exchanges through REST and WebSocket APIs for real-time market data, order execution and balance management.
- Interact programmatically with smart contracts and DeFi protocols, handling transaction construction, execution state and network-specific constraints.
- Develop execution logic that accounts for fees, liquidity, slippage, bridge costs and execution risk, rather than relying solely on theoretical price differences.
- Build latency-sensitive backend services in Go, using concurrency to monitor markets and react efficiently to state changes.
- Deploy and operate long-running trading services on Linux, using structured logging and monitoring to investigate execution behaviour and failures.
- Continuously explore new protocols and market structures to evaluate whether they create viable opportunities for automation.

Software Developer — Atlantic Technology International

Nov 2025 - Present

Develop web applications, internal tooling and automation solutions for real business workflows.

- Build backend functionality and custom internal applications according to business requirements.
- Develop integrations and automation workflows, including solutions that incorporate AI services.
- Work across the development lifecycle, from understanding a problem and designing a solution to implementation and deployment.
- Build maintainable software for real users and adapt technical decisions to operational and business constraints.

TECHNICAL WORK

MEV / Arbitrage Systems

I would say my specialty is around cross-chain AMM arbitrage. Most of my focus has been here and I have tons of private projects that I have personally these last years.

Key areas: protocol integration · smart contract interaction · transaction execution · opportunity detection · fee modelling · bridge costs · slippage · concurrency · monitoring

CEX Trading Infrastructure

Built integrations with centralized exchanges for automated market monitoring and execution. I have also worked with hedging monitoring and managing systems.

Key areas: WebSockets · REST APIs · market data · order execution · exchange state · error recovery · real-time processing

Vernier - Open source cross-chain arbitrage framework

I am currently building Vernier, an open-source cross-chain arbitrage framework born from my own experience developing arbitrage systems. The goal is to turn what I have learned into a modular and reusable framework that others can run, extend and contribute to, while pushing myself to solve the engineering challenges involved in building a more general-purpose system.

EDUCATION

CEI	2024 - 2026
Higher Technician in Web Application Development	

University of Huelva	2018 - 2022
BA in English Studies	

LANGUAGES

- Spanish: Native
- English: Professional / Advanced
